Santos 两流一固三相介质模型解析解

考虑一个体力源按照组分的体积含量分配在固体相和流体相上时, 对文中(3)式和(8)式作傅里叶变换可以得到频域的 Santos 波动方程:

$$\begin{aligned} \omega^2 \left[\tilde{D}_{11} \tilde{\mathbf{u}} + \tilde{D}_{12} \tilde{\mathbf{U}}^{(1)} + \tilde{D}_{13} \tilde{\mathbf{U}}^{(2)} \right] + N \nabla^2 \tilde{\mathbf{u}} + \nabla \left[(A+N) \nabla \cdot \tilde{\mathbf{u}} + Q_1 \nabla \cdot \tilde{\mathbf{U}}^{(1)} + Q_2 \nabla \cdot \tilde{\mathbf{U}}^{(2)} \right] &= (1-\phi) \tilde{\mathbf{f}}, \\ \omega^2 \left[\tilde{D}_{12} \tilde{\mathbf{u}} + \tilde{D}_{22} \tilde{\mathbf{U}}^{(1)} + \tilde{D}_{23} \tilde{\mathbf{U}}^{(2)} \right] + \nabla \left[Q_1 \nabla \cdot \tilde{\mathbf{u}} + R_1 \nabla \cdot \tilde{\mathbf{U}}^{(1)} + R_3 \nabla \cdot \tilde{\mathbf{U}}^{(2)} \right] &= S_1 \phi \tilde{\mathbf{f}}, \\ \omega^2 \left[\tilde{D}_{13} \tilde{\mathbf{u}} + \tilde{D}_{23} \tilde{\mathbf{U}}^{(1)} + \tilde{D}_{33} \tilde{\mathbf{U}}^{(2)} \right] + \nabla \left[Q_2 \nabla \cdot \tilde{\mathbf{u}} + R_3 \nabla \cdot \tilde{\mathbf{U}}^{(1)} + R_2 \nabla \cdot \tilde{\mathbf{U}}^{(2)} \right] &= S_2 \phi \tilde{\mathbf{f}}, \end{aligned} \quad (\text{A1})$$

式中, $\tilde{\mathbf{u}}$, $\tilde{\mathbf{U}}^{(1)}$, $\tilde{\mathbf{U}}^{(2)}$ 和 $\tilde{\mathbf{f}}$ 分别表示固体相、非润湿相、润湿相和体力的傅里叶变换. 引入势函数 $\varphi_1, \varphi_2, \varphi_3, \psi_1, \psi_2, \psi_3, \Phi, \Psi$, 则:

$$\begin{aligned} \tilde{\mathbf{u}} &= \nabla \varphi_1 + \nabla \times \psi_1, \\ \tilde{\mathbf{U}}^{(1)} &= \nabla \varphi_2 + \nabla \times \psi_2, \\ \tilde{\mathbf{U}}^{(2)} &= \nabla \varphi_3 + \nabla \times \psi_3, \\ \tilde{\mathbf{f}} &= \nabla \Phi + \nabla \times \Psi. \end{aligned} \quad (\text{A2})$$

这里, $\nabla \times \psi_1 = \nabla \times \psi_2 = \nabla \times \psi_3 = \nabla \times \Psi = 0$. 假设声源为胀缩源且 $\Phi = \delta(r) s(\omega)$,

将(A2)式代入(A1)式得到非齐次线型方程组:

$$\begin{aligned}
 \omega^2 [\tilde{D}_{11}\varphi_1 + \tilde{D}_{12}\varphi_2 + \tilde{D}_{13}\varphi_3] + [P\nabla^2\varphi_1 + Q_1\nabla^2\varphi_2 + Q_2\nabla^2\varphi_3] &= (1-\phi)\delta(r)s(\omega), \\
 \omega^2 [\tilde{D}_{12}\varphi_1 + \tilde{D}_{22}\varphi_2 + \tilde{D}_{23}\varphi_3] + [Q_1\nabla^2\varphi_1 + R_1\nabla^2\varphi_2 + R_3\nabla^2\varphi_3] &= S_1\phi\delta(r)s(\omega), \\
 \omega^2 [\tilde{D}_{13}\varphi_1 + \tilde{D}_{23}\varphi_2 + \tilde{D}_{33}\varphi_3] + [Q_2\nabla^2\varphi_1 + R_3\nabla^2\varphi_2 + R_2\nabla^2\varphi_3] &= S_2\phi\delta(r)s(\omega),
 \end{aligned} \tag{A3}$$

(A3)式可以等效转换为齐次线性方程组与声源处正则化条件描述的问题。为了得到正则化条件，对(A3)式在一个小的球形区域进行体积分，当球的半径趋于零时，根据高斯定理和球形对称条件，有

$$\begin{aligned}
 \lim_{\sigma \rightarrow 0} \int_{s_\sigma} \left(P \frac{\partial \varphi_1}{\partial r} + Q_1 \frac{\partial \varphi_2}{\partial r} + Q_2 \frac{\partial \varphi_3}{\partial r} \right) ds &= (1-\phi)\delta(r)s(\omega), \\
 \lim_{\sigma \rightarrow 0} \int_{s_\sigma} \left(Q_1 \frac{\partial \varphi_1}{\partial r} + R_1 \frac{\partial \varphi_2}{\partial r} + R_3 \frac{\partial \varphi_3}{\partial r} \right) ds &= S_1\phi\delta(r)s(\omega), \\
 \lim_{\sigma \rightarrow 0} \int_{s_\sigma} \left(Q_2 \frac{\partial \varphi_1}{\partial r} + R_3 \frac{\partial \varphi_2}{\partial r} + R_2 \frac{\partial \varphi_3}{\partial r} \right) ds &= S_2\phi\delta(r)s(\omega).
 \end{aligned} \tag{A4}$$

根据(A3)式和(A4)式可求得：

$$\begin{aligned}
 \varphi_1(r, \omega) &= \frac{s(\omega)(\alpha e^{-ik_{p1}r} + \beta e^{-ik_{p2}r} + \gamma e^{-ik_{p3}r})}{4\pi r}, \\
 \varphi_2(r, \omega) &= \frac{s(\omega)(\alpha A_{p1} e^{-ik_{p1}r} + \beta A_{p2} e^{-ik_{p2}r} + \gamma A_{p3} e^{-ik_{p3}r})}{4\pi r}, \\
 \varphi_3(r, \omega) &= \frac{s(\omega)(\alpha B_{p1} e^{-ik_{p1}r} + \beta B_{p2} e^{-ik_{p2}r} + \gamma B_{p3} e^{-ik_{p3}r})}{4\pi r},
 \end{aligned} \tag{A5}$$

式中， k_{pi} 为第*i*种纵波的波数。 A_{pi} ， B_{pi} ， α ， β ， γ 的表达式满足以下关系式：

$$A_{pi} = - \frac{\begin{vmatrix} V_{pi}^2 D_{11} - P & V_{pi}^2 D_{13} - Q_2 \\ V_{pi}^2 D_{12} - Q_1 & V_{pi}^2 D_{23} - R_3 \end{vmatrix}}{\begin{vmatrix} V_{pi}^2 D_{12} - Q_1 & V_{pi}^2 D_{13} - Q_2 \\ V_{pi}^2 D_{22} - R_1 & V_{pi}^2 D_{23} - R_3 \end{vmatrix}}, \quad B_{pi} = - \frac{\begin{vmatrix} V_{pi}^2 D_{11} - P & V_{pi}^2 D_{12} - Q_1 \\ V_{pi}^2 D_{12} - Q_1 & V_{pi}^2 D_{22} - R_1 \end{vmatrix}}{\begin{vmatrix} V_{pi}^2 D_{12} - Q_1 & V_{pi}^2 D_{13} - Q_2 \\ V_{pi}^2 D_{22} - R_1 & V_{pi}^2 D_{23} - R_3 \end{vmatrix}},$$

$$\begin{bmatrix} P + Q_1 A_{p_1} + Q_2 B_{p_1} & P + Q_1 A_{p_2} + Q_2 B_{p_2} & P + Q_1 A_{p_3} + Q_2 B_{p_3} \\ Q_1 + R_1 A_{p_1} + R_3 B_{p_1} & Q_1 + R_1 A_{p_2} + R_3 B_{p_2} & Q_1 + R_1 A_{p_3} + R_3 B_{p_3} \\ Q_2 + R_3 A_{p_1} + R_2 B_{p_1} & Q_2 + R_3 A_{p_2} + R_2 B_{p_2} & Q_2 + R_3 A_{p_3} + R_2 B_{p_3} \end{bmatrix} \begin{bmatrix} \alpha \\ \beta \\ \gamma \end{bmatrix} = \begin{bmatrix} -s(\omega)(1-\phi)/4\pi \\ -s(\omega)S_1\phi/4\pi \\ -s(\omega)S_2\phi/4\pi \end{bmatrix},$$

当 $\eta_f^{(1)} = \eta_f^{(2)} = 0$ 时, 对 (A5) 式进行反傅里叶变换可求得时域点源激发声场的解析式:

$$\begin{aligned} \varphi_1(r, t) &= \frac{\alpha s(t-r/V_{p_1}) + \beta s(t-r/V_{p_2}) + \gamma s(t-r/V_{p_3})}{4\pi r}, \\ \varphi_2(r, t) &= \frac{\alpha A_{p_1} s(t-r/V_{p_1}) + \beta A_{p_2} s(t-r/V_{p_2}) + \gamma A_{p_3} s(t-r/V_{p_3})}{4\pi r}, \\ \varphi_3(r, t) &= \frac{\alpha B_{p_1} s(t-r/V_{p_1}) + \beta B_{p_2} s(t-r/V_{p_2}) + \gamma B_{p_3} s(t-r/V_{p_3})}{4\pi r}. \end{aligned} \quad (\text{A6})$$

对于沿 y 轴的胀缩线源激发声场解析解, 可通过对 (A6) 式沿 y 轴积分求得

$$\begin{aligned} \varphi_1(x, z, t) &= \frac{\alpha H(t-d/V_{p_1})}{2\pi} \int_{d/V_{p_1}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_1}^2}} d\tau \\ &+ \frac{\beta H(t-d/V_{p_2})}{2\pi} \int_{d/V_{p_2}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_2}^2}} d\tau + \frac{\gamma H(t-d/V_{p_3})}{2\pi} \int_{d/V_{p_3}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_3}^2}} d\tau, \\ \varphi_2(x, z, t) &= \frac{\alpha A_{p_1} H(t-d/V_{p_1})}{2\pi} \int_{d/V_{p_1}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_1}^2}} d\tau \\ &+ \frac{\beta A_{p_2} H(t-d/V_{p_2})}{2\pi} \int_{d/V_{p_2}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_2}^2}} d\tau + \frac{\gamma A_{p_3} H(t-d/V_{p_3})}{2\pi} \int_{d/V_{p_3}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_3}^2}} d\tau, \\ \varphi_3(x, z, t) &= \frac{\alpha B_{p_1} H(t-d/V_{p_1})}{2\pi} \int_{d/V_{p_1}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_1}^2}} d\tau \\ &+ \frac{\beta B_{p_2} H(t-d/V_{p_2})}{2\pi} \int_{d/V_{p_2}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_2}^2}} d\tau + \frac{\gamma B_{p_3} H(t-d/V_{p_3})}{2\pi} \int_{d/V_{p_3}}^t \frac{s(t-\tau)}{\sqrt{\tau^2 - d^2/V_{p_3}^2}} d\tau. \end{aligned} \quad (\text{A7})$$
